

Use of SDX in direct broadcasts for remote creation of summary/ highlights

SDX receives signals in parallel with replay servers. Due to LTC presence, recorded stream rate video is synchronous with replay servers. The stream quality depends on internet channel between OB Van and remote location. Proxy video is transmitted to NAS. The special client MAM version allows

operator-editors to instantly create playlists for broadcasting. Advantage of this solution is that number of broadcast replay servers can be reduced and it also reduces expenses for broadcast staff at the venue. Remote studio operators will do the job much more efficient.
